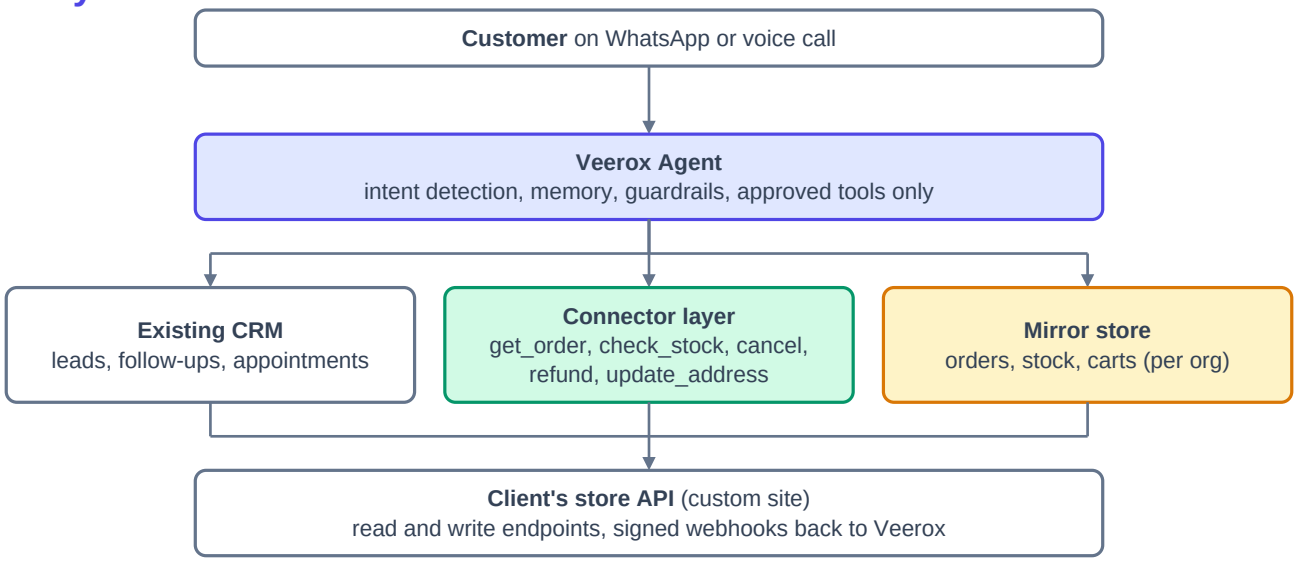
Ecommerce Integration for the Veerox AI Agent

Workflow and architecture. Custom store, covering live lookup, store actions, webhook sync and cart/COD outreach.

1. What the AI can do

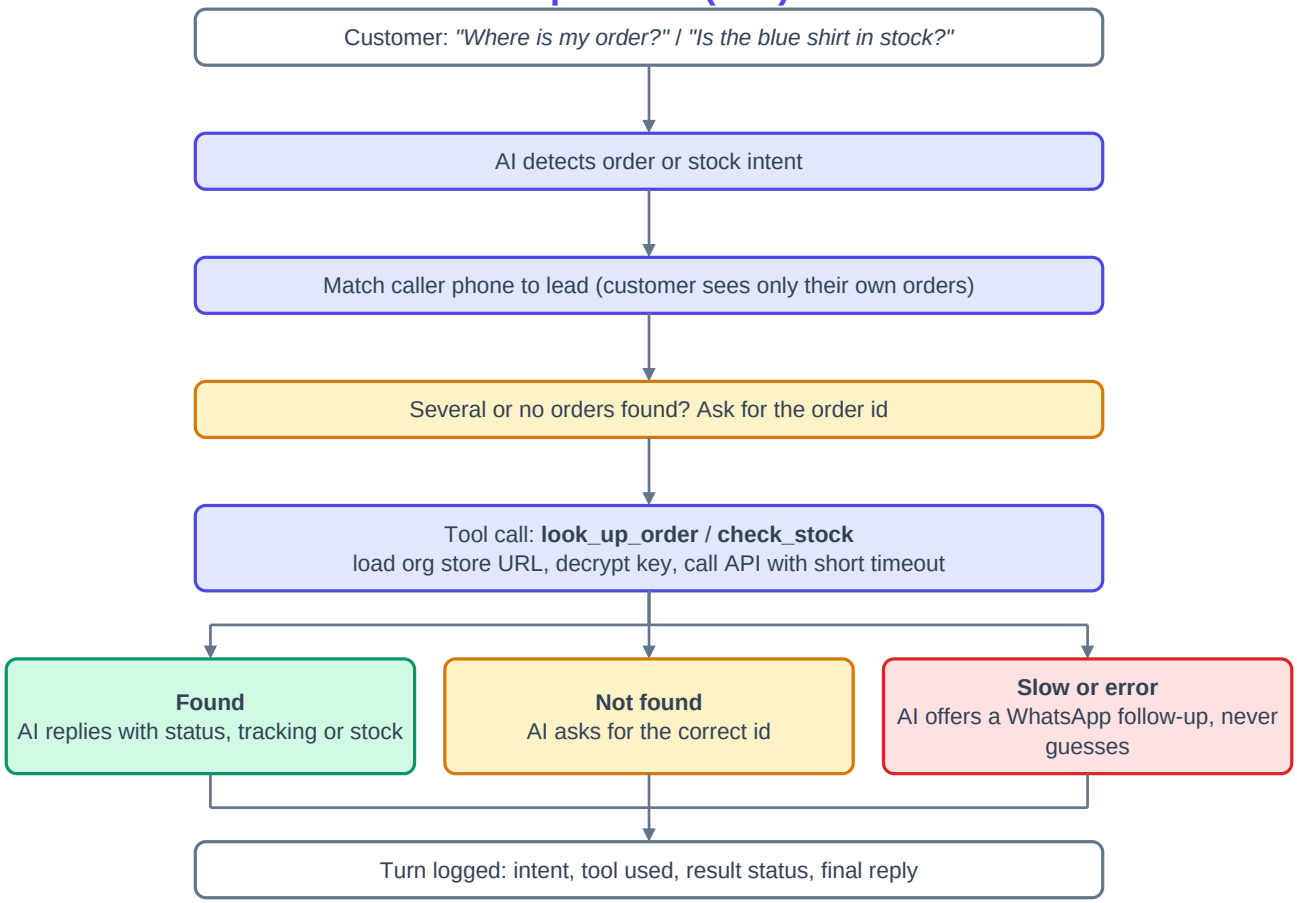
- **Order status and tracking** answered from the client's live store data.
- **Stock and availability** checks by product name or SKU.
- **Store actions** on request: cancel an order, request a refund, edit the delivery address.
- **Abandoned-cart and COD outreach** by WhatsApp template or call.
- **Reorder and product suggestions** from past orders.
- **Human handoff** when the issue is beyond the AI (large refunds, anger, unknown question).

2. System architecture

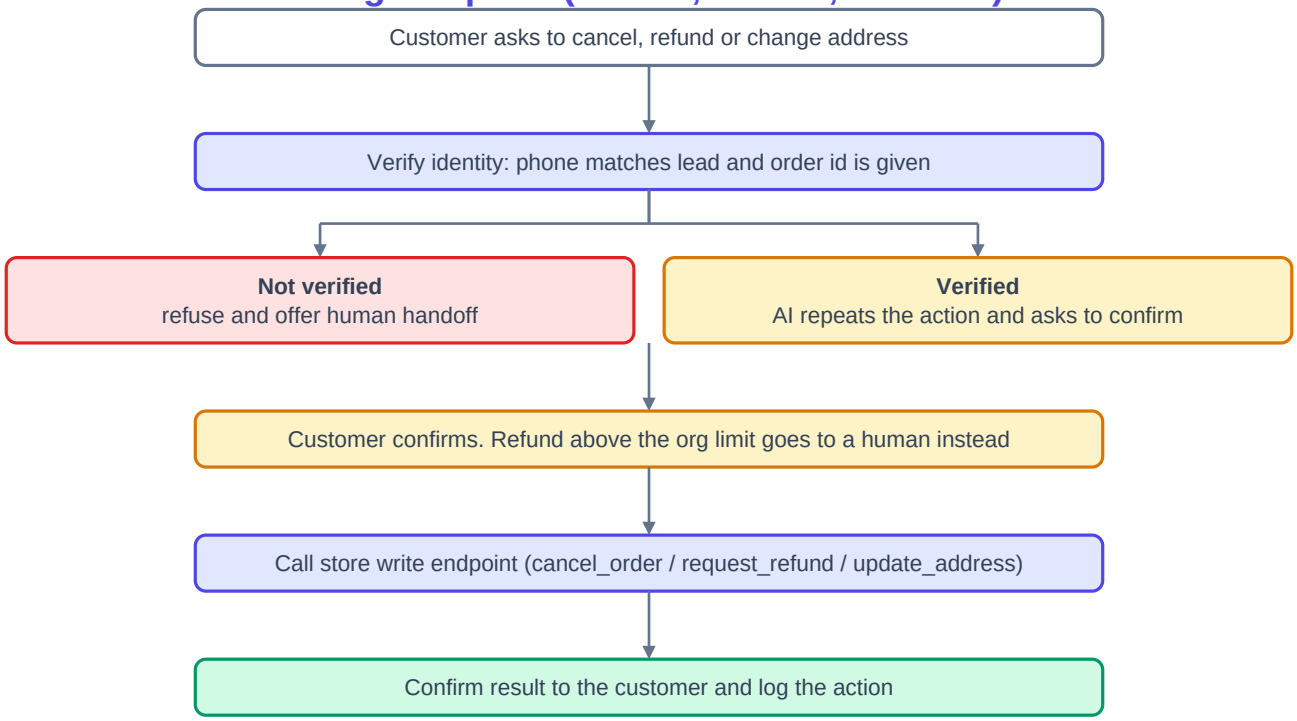


- Store keys are encrypted per org and never sent to the AI model.
- Every query is scoped to the org and to the customer matched by phone number.
- The kill switch and per-org feature flag turn the feature off instantly.

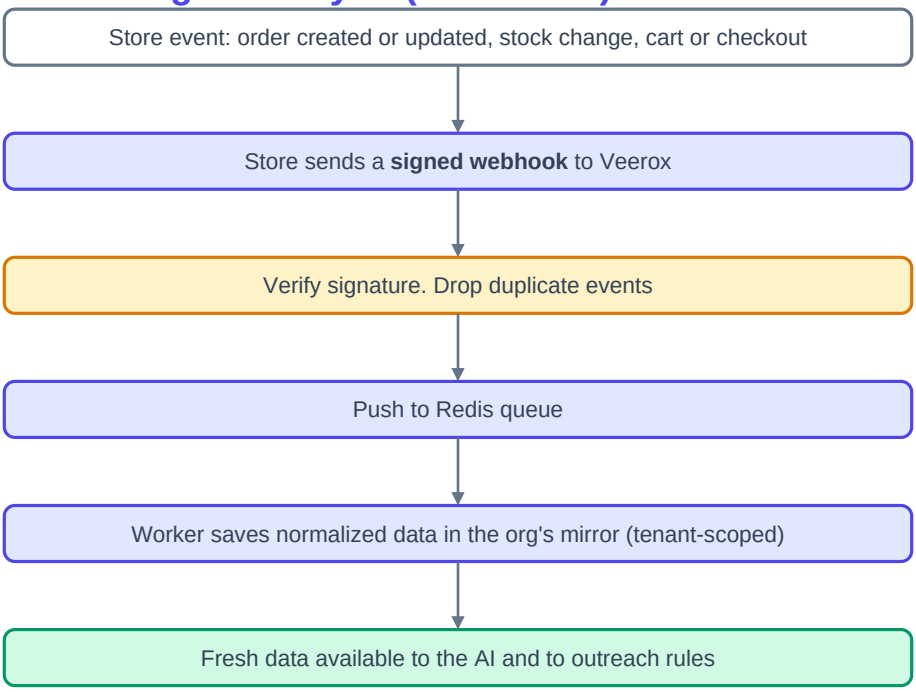
3. Workflow A: order or stock question (live)



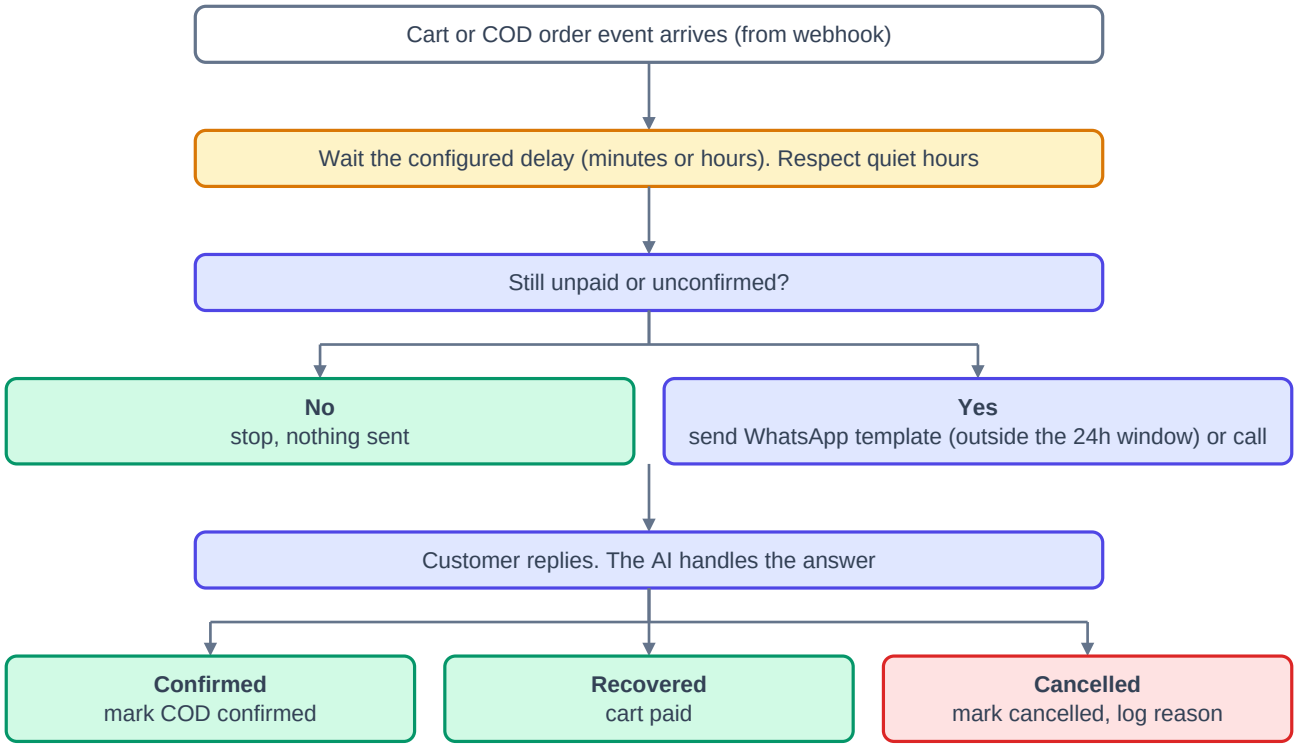
4. Workflow B: change request (cancel, refund, address)



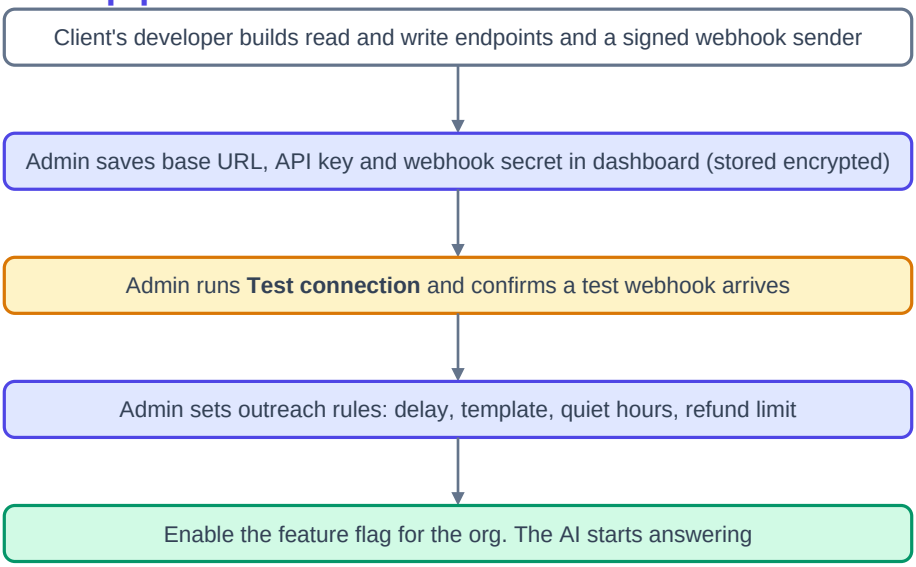
5. Workflow C: background sync (webhooks)



6. Workflow D: abandoned cart and COD confirmation



7. One-time setup per client



8. What the client's developer provides

Endpoint	Purpose	Returns
GET order by phone or id	Order lookup	status, items, shipping, tracking
GET stock by SKU or name	Stock check	availability, quantity
POST cancel / refund / address	Store actions	success or failure and reason
Signed webhooks	Order, stock, cart events	event type, payload, signature
Base URL and API key	Access	read and write scopes, webhook secret

9. What we build in Veerox

Part	Detail
Store settings per org	Base URL, key, webhook secret, encrypted; test connection; on/off flag
Connector layer	One interface for orders, products, stock, carts; custom adapter first, others one adapter each
Agent tools	look_up_order, check_stock, cancel_order, request_refund, update_address
Webhook receiver and mirror	Signature check, de-duplication, Redis queue, tenant-scoped storage
Outreach	Abandoned-cart and COD rules through existing campaign workers and WhatsApp templates
Customer matching	Phone number to lead, own data only
Dashboard	Store settings, sync status, outreach rules, turn log

10. Safety rules

- Every query is scoped to the org and the matched customer.
- Write actions need verification and an explicit confirmation from the customer.
- The AI never guesses an order status. If the store is slow, it says so and offers a follow-up.
- Keys are encrypted and never sent to the model. Only needed fields go in the prompt.
- Every turn and action is logged. The kill switch disables the feature instantly.
